

Questions

Q1.

A potential difference of 50 V is applied between two identical parallel aluminium plates. The plates are separated by a distance of 10 mm.

Which combination of potential difference and separation would double the electric field strength?

	Separation/mm	Potential difference/ V
☐ A	20	100
☐ B	20	25
☐ C	10	100
☐ D	10	25

Q2.

Some flowers are negatively charged and surrounded by an electric field. This helps to attract bees.

When the bee is collecting nectar from the plant, the electric field strength decreases. It is thought that this warns other bees that the nectar supply is low.

State the effect of a decreased electric field strength on the equipotential lines.

Q3.

Answer the question with a cross in the box you think is correct ☒. If you change your mind about an answer, put a line through the box ☐ and then mark your new answer with a cross ☒.

The graph shows how an electric potential V varies with distance x .

Which of the following shows the corresponding variation of electric field strength E with x ?

☒ A

☐ B

☐ C

☐ D

(Total for question = 1 mark)

Q4.

An electron travelling horizontally enters a uniform electric field which acts vertically downwards as shown in the diagram.

Which of the following statements is **incorrect**?

- ☐ **A** The electron follows a parabolic path.
- ☐ **B** The electron accelerates while in the field.
- ☐ **C** The electric force on the electron acts downwards.
- ☐ **D** The speed of the electron increases.

(Total for question = 1 mark)

Q5.

Answer the question with a cross in the box you think is correct (☐). If you change your mind about an answer, put a line through the box (☒) and then mark your new answer with a cross (☐).

A potential difference V is applied across two parallel plates. An electron midway between the two plates at point X experiences an electric force F .

The electron moves to point Y which is halfway between point X and the left-hand plate.

Which of the following is the electric force experienced by the electron at Y?

☐ **A** $2F$

☐ **B** F

☐ **C** $\frac{F}{2}$

☐ **D** $\frac{F}{4}$

Q6. Two parallel, conducting plates are connected to a battery. One plate is connected to the positive terminal and the other plate to the negative terminal. The plate separation d is gradually increased while the plates stay connected to the battery.

Select the graph that shows how the electric field strength E between the plates varies with separation d .

☐ **A**

☐ **B**

☐ **C**

☐ **D**

Q8.

Which of the following is a property of a uniform electric field?

- ☐ **A** A field that doesn't change over time.
- ☐ **B** A field that acts equally in all directions.
- ☐ **C** A field that only produces a force on moving charged particles.
- ☐ **D** A field that has the same strength at all points.

Q9.

Protons interact with particles in the upper atmosphere and create new particles. Pions can be produced from high energy proton collisions.

(i) State why the following reaction is not possible.

(1)

.....
.....
(ii) State one similarity and one difference between the electric field of a proton and the electric field of a π^- .

(2)

Q10.

The diagram shows a model used to demonstrate alpha particle scattering. A ball bearing is set rolling on a wooden track. The track is positioned so that the ball bearing rolls onto a metal sheet with a curved surface known as a 'hill'.

The diagram shows a vertical cross-section through the hill. The surface is curved so that the height of a point h on the curved surface is inversely proportional to the distance r from the centre of the hill.

Explain why the hill is suitable as a model for the electric field surrounding the nucleus of an atom.

Q12.

Tiny sensors in smartphones could be used to determine the position of the phone on the Earth's surface by measuring the Earth's magnetic flux density.

A current I and a magnetic field of flux density B are applied to a slice of semiconductor as shown. The slice has thickness t and depth d .

Electrons collect at the top edge of the slice and the bottom edge becomes positively charged. As a result a potential difference known as a Hall voltage V_{HALL} develops.

Electrons continue to collect at the top edge of the slice, until the force on a moving electron due to the magnetic field is equal to the force on the electron due to the electric field.

Derive the following equation for V_{HALL} :

$$V_{\text{HALL}} = \frac{BI}{nte}$$

where n is the number of charge carriers per unit volume of the semiconductor.

Q14.

In an experiment to determine the charge on an electron, negatively charged oil drops are allowed to fall between two parallel metal plates separated by a distance d .

A potential difference (p.d.) is applied across the plates. The diagram shows one oil drop between the plates.

When the p.d. is 0 V the oil drop accelerates to terminal velocity. The p.d. is increased. It is observed that at a particular p.d. V the oil drop stops falling and remains stationary between the plates.

- (a) The oil drop has a mass m . Show that the charge q on the oil drop is given by

$$q = \frac{mgd}{V}$$

(2)

.....

.....

.....

- (b) Explain what would happen to the oil drop if the p.d. is increased further.

Q15.

A magician did a trick which he claimed was the most dangerous ever. He positioned himself midway between two charged spheres which were separated by a distance of about two metres. Each sphere was charged to a potential that would cause ionisation at a distance of one metre. He wore a protective suit of chain mail and a helmet consisting of a metal cage. The protective suit and helmet were earthed to a potential of 0 V.

A scientist said "there is no danger in this and I would happily do it tomorrow".

Explain whether this statement is justified.

Q16. A teacher uses an electron beam tube to demonstrate the behaviour of electrons in an electric field. The diagram shows the path of an electron in a uniform electric field between two parallel conducting plates.

(a) Mark on the diagram the direction of the electric field. (1)

(b) The conducting plates are 5.0 cm apart and have a potential difference of 160 V across them.

Calculate the force on the electron due to the electric field. (3)

.....

.....

.....

.....

.....

Force =

(c) Explain why the path of the electron is curved between the plates and straight when it has left the plates. (3)

.....

.....

.....

.....

.....

.....

(d) The electron was initially released from a metal by thermionic emission and then accelerated through a potential difference before entering the region of the electric field.

(i) State what is meant by thermionic emission. (1)

.....

.....

(ii) In order to be able to just leave the plates as shown, the electron must enter the electric field between the plates with a speed of $1.2 \times 10^7 \text{ m s}^{-1}$.

Calculate the potential difference required to accelerate an electron from rest to this speed. (3)

Potential difference =

Q17.

Some flowers are negatively charged and surrounded by an electric field. This helps to attract bees.

The diagram shows lines of equipotential surrounding a flower.

(i) Determine the electric field strength at X.

(3)

.....

.....

.....

Electric field strength at X =

(ii) Draw the electric field line between point A and point B on the diagram.

(2)

(iii) An equation for electric potential V is

$$V = \frac{Q}{4\pi\epsilon_0 r}$$

This applies to a radial field.

Deduce whether the electric field in the region directly above the flower is radial. You should take values from the diagram. A graphical method is not required.

Q18.

Our understanding of the atom has developed over time, from early models in which atoms were considered to be hard incompressible spheres, through to the nuclear model of the atom and the ladder model in which electrons exist in a discrete number of allowed energy states.

The nuclear model of the atom was established following a series of experiments in which alpha particles were directed at thin gold foil.

(i) An alpha particle approaching a gold nucleus, $^{197}_{79}\text{Au}$, head-on will be brought to rest and returned along its original path.

Calculate the minimum distance between the alpha particle and the nucleus for alpha particles of energy of 5.5 MeV.

(4)

.....

.....

.....

.....

.....

.....

.....

.....

Minimum distance =

(ii) It is observed that electrons, with energy of 5.5 keV, are diffracted as they pass through the thin gold foil.

Explain a conclusion about the electrons that can be made from this observation.

Q20.

Motors usually have a rotating component which can do work W .

(a) A motor lifts a load in a time t . The axle of the motor has a radius r and exerts a force F .

The power produced by a motor can be calculated by using the following word equation.

Power = moment of the force exerted by the rotating axle × angular velocity

Derive this equation, starting with power $P = \frac{W}{t}$.

(4)

.....

.....

.....

.....

.....

.....

(b) An electrostatic motor was first demonstrated by Benjamin Franklin in 1750.

The diagram shows a simplified version of part of this motor.

This consists of a rod, with an oppositely charged sphere at either end, which rotates around a fixed pivot. Two stationary charged spheres apply a force on the spheres at either end of the rod.

(i) In the diagram below, electric field lines have been drawn around one pair of these spheres.

Add to the diagram to show

- the directions of the field lines
- the lines of equipotential.

(3)

(ii) The distance between the centres of each charged sphere in this pair is 5.0 cm.

Show that the force between this pair of charged spheres is about 0.04 N.

charge on each sphere = $0.10 \mu\text{C}$

(2)

.....

.....

.....

.....

.....

(c) The table shows the typical power and the corresponding angular velocity required for three different appliances.

You should use the word equation in (a) and assume that the length of the rod in the electrostatic motor is 8.0 cm.

Q21.

Cathode ray tubes are used in oscilloscopes.

The diagram shows a simplified cathode ray tube that can be used to determine the magnitude and polarity of a potential difference (p.d.).

The cathode ray tube consists of an electron gun, a pair of deflecting plates and a fluorescent screen.

(a) The electron gun includes a filament. When this filament is heated, electrons are released and are accelerated by a p.d. of 1.5 kV to form an electron beam.

(i) Name the process by which electrons are released from the heated filament.

(1)

.....

(ii) Show that the maximum velocity of the electrons is about $2 \times 10^7 \text{ m s}^{-1}$.

(2)

.....

.....

.....

.....

(b) The electron beam then enters a uniform electric field between the two parallel horizontal deflecting plates. The magnitude and direction of the deflection is determined by the p.d. V that

is applied across the plates.

The diagram shows one possible path of the electron beam as it passes between the plates.

(i) Show that the acceleration of an electron, of mass m and charge Q , is given by

$$\frac{VQ}{dm}$$

(2)

.....

.....

.....

.....

(ii) Calculate the magnitude of the vertical deflection y of the beam as it leaves the plates.

$$V = 50\text{ V}$$
$$d = 0.01\text{ m}$$

(5)

.....

.....

.....

.....

.....

.....

.....

.....

.....

$$y = \dots\dots\dots$$

(c) A laboratory oscilloscope with the time base turned off operates in the same way as this simplified cathode ray tube. A student uses an oscilloscope in this way to monitor an alternating p.d. of 53 V_{rms}

On the grid, draw the trace that would be seen on the screen.

Q22. The charge on an electron was originally measured in an experiment called the Millikan Oil Drop experiment.

In a simplified version of this experiment, an oil drop with a small electric charge is placed between two horizontal, parallel plates with a large potential difference (p.d.) across them. The p.d. is adjusted until the oil drop is stationary.

For a particular experiment, a p.d. of 5100 V was required to hold a drop of mass $1.20 \times 10^{-14}\text{ kg}$ stationary.

(a) Add to the diagram to show the electric field lines between the plates.

(3)

(b) State whether the charge on the oil drop is positive or negative.

(1)

.....

(c) Complete the free-body force diagram to show the forces acting on the oil drop. You should ignore upthrust.

(2)

(d) (i) Calculate the magnitude of the charge on the oil drop.

(4)

.....
.....
.....
.....
.....
.....

Charge =

(ii) Calculate the number of electrons that would have to be removed or added to a neutral oil drop for it to acquire this charge.

(2)

.....
.....

.....
Number of electrons =

Q23.

(a) Explain what is meant by the term electric field strength.

(2)

.....
.....
(b) (i) Two point charges Q_1 and Q_2 are placed 20 cm apart. Q_1 has a charge of $+3.0 \mu\text{C}$ and Q_2 has a charge of $+6.5 \mu\text{C}$.

At point P , a distance 8.1 cm from Q_1 , the electric field strength is approximately zero.

Demonstrate by calculation that this statement is correct.

(3)

(ii) A charge of $+4.5\text{ }\mu\text{C}$ is placed at point P .
State the magnitude of the force acting on this charge.

(1)

.....

(iii) The $+4.5\text{ }\mu\text{C}$ charge is moved from point P to a point half way between Q_1 and Q_2 .
Explain qualitatively why energy would be needed for this movement.

(2)
